## MECHANISM OPERATION DESCRIPTION

### Mechanism Operation Description

Fig. 1 shows the relationship of mechanisms in the STOP mode. The OPEN/CLOSE operation of the mechanism and the UP/DOWN operation of the pickup chassis when loading the disc are description below.

**Note 1 :** The black arrow (OPEN) and the while arrow (CLOSE) in the operation description have the following meanings :

**Black arrow (OPEN) :** Tray opening direction  
(Tray OPEN)

**White arrow (CLOSE):** Tray closing direction  
(Tray CLOSE)

**Note 2 :** Figures in the bracket ( ) in the operation description or accompanied with the part name in the diagram show the reference numbers in the Exploded View.

## MECHANISM OPERATION DESCRIPTION

### MECHANISM OPERATION

#### 1. OPEN/CLOSE FUNCTION

By the rotation of the loading motor (①), Gear (②) is rotated and the tray starts OPEN/CLOSE operation (③).

The OPEN/CLOSE operation stops when the projection of the slider comes in contact with the detection switch (④).

#### 2. PICKUP CHASSIS TRAVELING

According to tray's OPEN/CLOSE operation (①), the shaft of lever moves (②). And then slider travels by the lever with gear (③).

Along with the grooves in the lever, the pickup chassis moves up and down (④).

## ADJUSTMENT

- RF signal and E.Spot signal in test mode (PLAY).
- If the diffraction grating has been adjusted properly, the influence of triggering is observed on the E.Spot waveform of approx. 18µs after RF signal, in the form of a projection.

- RF signal and T.Error signal; in test mode (Focusing ON). (Disc type 4)
- Adjust T.Error so that the waveform is symmetrical above and below 0V (VR104).

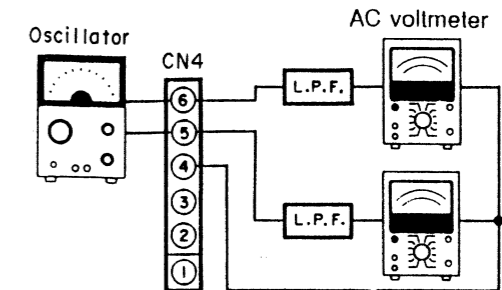

- RF signal in test mode (PLAY).
- Perform the tangential and focusing offset adjustments so that each of the center cross points are focused into one point on the display. The crossing points above and below the center shall also be displayed clearly.
